

OrangeHRM – Manual Testing Project

Project Overview

This project demonstrates my practical experience in **manual software testing** using the OrangeHRM web application.

The project covers test case design, functional and UI testing, bug reporting, test management using Jira, and API testing using Postman.

The main objective was to identify defects, verify expected application behavior, document test results, and manage reported issues following a structured QA testing process.

Testing Scope

The testing activities focused on the following areas of the OrangeHRM application:

- Login functionality
- User and employee management
- Navigation and UI elements
- Form validation
- Data input and validation
- Functional behavior
- Error handling
- API requests and responses

Testing Performed

The project includes the following testing activities:

- **Functional Testing** – verification that application features work according to their expected behavior
- **UI Testing** – verification of interface elements, layout, navigation, and usability
- **Positive Testing** – validation using valid inputs and expected user actions
- **Negative Testing** – validation using invalid inputs and unexpected user actions
- **Regression Testing** – verification that existing functionality continues to work after changes
- **Exploratory Testing** – unscripted testing to identify unexpected behavior and potential defects
- **API Testing** – testing API endpoints and validating requests, responses, and status codes using Postman

Test Cases

Test cases were designed and documented in Excel.

The test cases include:

- Test Case ID
- Test Scenario
- Preconditions
- Test Steps
- Test Data
- Expected Result
- Actual Result
- Test Status

Bug Reporting

Defects identified during testing were documented and managed using Jira.

The bug reports include relevant information such as:

- Bug title
- Description
- Preconditions
- Steps to reproduce
- Expected result
- Actual result
- Severity
- Priority
- Evidence / screenshots

Jira

Jira was used to manage and track the identified defects.

The project board was used to organize and monitor bug reports throughout the testing process.

API Testing – Postman

API testing was performed using **Postman**.

The Postman collection contains requests created to verify API functionality and validate server responses.

The testing included:

- HTTP request methods
- Status code validation
- Response validation
- Request and response data
- Positive and negative scenarios

[View Orange test collection.postman_collection.json](#)

The collection can be imported directly into Postman for review and execution.

Tools & Technologies

OrangeHRM	Web application under test
Jira	Bug tracking and test management
Postman	API testing
Microsoft Excel	Test case documentation
GitHub	Project documentation and version control

Key Skills Demonstrated

Through this project, I demonstrated practical knowledge of:

- Manual Software Testing
- Test Case Design
- Functional Testing
- UI Testing
- Positive & Negative Testing
- Regression Testing
- Exploratory Testing
- Bug Reporting
- Jira
- API Testing
- Postman
- Test Documentation
- Defect Tracking
- GitHub
